Keep for record
what is highest
the enamel
order in high so they*

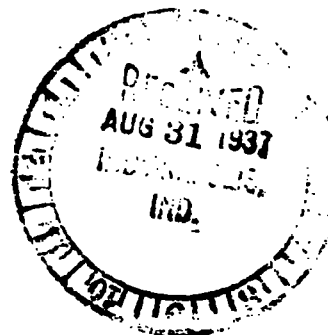

We are enclosing in a separate envelope some pictures we took of ground tank #16, showing the way the tank was prepared for further service.

This is the tank that became leaky, making it necessary to remove for repairs. After the tank was repaired and tested, it was sand blasted to thoroughly clean the surface and prepare for pipe enamel, next the tank was given a prime coat and then Reilly Pipe enamel was applied. After the enamel we gave the tank a coat of white wash, and finally covered the tank with tarred felt held in place by wire.

On the back of these photos you will note we have made a record explaining what each picture represents.

Yours very truly,
